GENERIC

Security USB Dongle

A big difference in 2014 Release 1 is that it requires a Security USB Dongle. This is to ensure that all valid users have got access to the data they are authorized to.

The Security USB Dongle is a "plug-n-play" solution that replaces the HW key. This means no more hassle with codes that needs to be typed in the installation.

The Security USB Dongle is activated online, and can be activated from any computer that has Internet connection.

The Security USB Dongle is paired with a specific VCI, but can be moved around to many computers.

All valid users will be supplied with a Security USB Dongle together with the release DVD.

Continuous update

The 2014 Release 1 includes the continuous update of parameters and modes specified in the legislated emission standards.

Differentiation

The CDP was introduced more than 10 years ago and was designed to handle all known communications types at that time.

The new CDP+ hardware enables new possibilities and functionality not available to the CDP due to hardware limitations. As the development of vehicle electronic systems and communication standards evolves so do Autocom products.
